Abstract: We present here the Advanced Virgo Computing Model, which we have defined to guarantee a production and analysis system which gives an easy and robust access to data and resources, for both commissioning and analysis. This document is intended to be a living document, updated with well defined cycles. In fact, an “Implementation Plan” will then describe the technical solutions, as they are foreseen with the actual computing resources, together with plans for testing them. The Model is sustained by a “Management Plan”, which addresses the management procedures to make reality checks on it. The Model is composed by fifth parts. The three main parts are the Computing Model workflow, the Data Model, the Data Management Distribution and Access. The last two parts, Software description and the Computing Facilities resource requirements, complete the information.
